Your Game Face FOR FEEDING.

This Product Is Available

A Close Shave FOR AN AIRTIGHT SEAL.

SILAGE FACER

Face off against spoilage.

To maintain quality feed it's important to keep air out. When silage is faced with a regular bucket, deep cracks and fissures can form. Air can penetrate through these cracks, feet deep into the silo potentially causing premature spoilage and reducing the quality of the feed. One of the best ways to avoid this is to keep a clean, smooth face that doesn't trap air or moisture. The HLA silage facer is designed to help you better manage your silage and maintain your feed quality. Not only does the facer help you maintain the face of your silo, it also gives you more control of how much feed you remove at a time further reducing waste.

Heavy Duty Roller Chains

Dual heavy duty roller chains transfer the power from the hydraulic drives to the cutting drum. They provide excellent slip resistance and are easily serviceable.

Hungry Teeth

The ravenous teeth are designed to slice and shave your toughest silage. Made from high tensile steel they are shaped to easily remove feed and not get clogged.

Dual Hydraulic Motors

The driving force behind the HLA Silage facer is two hydraulic motors that work together to provide the silage ripping power you need to get the job done right.
